

Scan and install

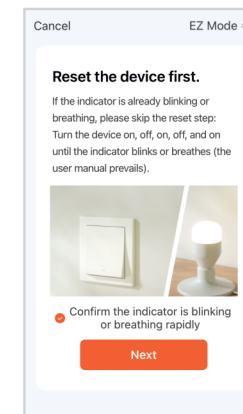

**1**

After you have installed Tuya Smart from the App Store or Play Store on your mobile device, you need to register and create an account. Your WiFi must be set to 2.4 GHz. Then tap the plus button in the app to add a new device.

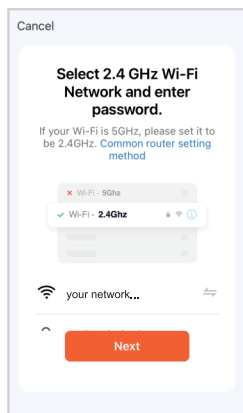

**2**

Select your item from the correct product category. For Eurolite illuminants select Lighting in the list on the left and then tap on Light Source (Wi-Fi).

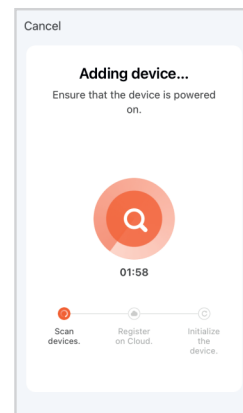

**3**

The illuminant must be in pairing mode to establish a connection. To do this, follow the instructions in the app to reset the device (or observe the product instructions), then confirm the query and tap Next.

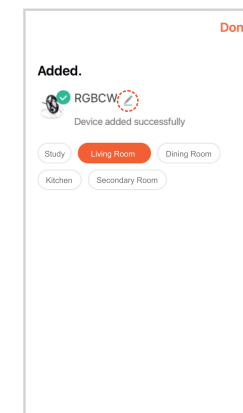

**4**

Now select a 2.4 GHz WiFi network, enter the password and tap Next.

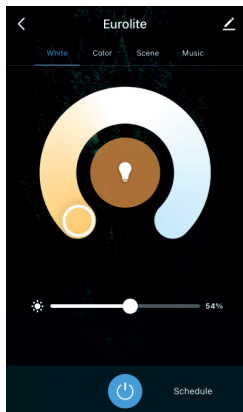

**5**

Pairing will now be started; the progress is displayed on the screen. After a few seconds, the illuminant stops blinking and the app confirms that it has been connected.

**6**

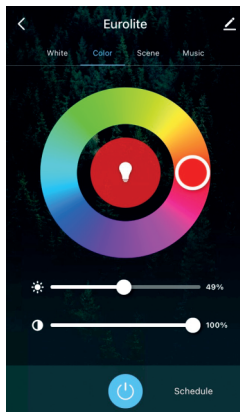

Now you can tap the stylus and give the illuminant a new name and assign a room. Finish the configuration with Done. You've done it! The illuminant can now be controlled with the app.

7

CCT: Touch the color wheel to adjust the color temperature. Move the dot to change the brightness. The button in the center is for switching on and off.

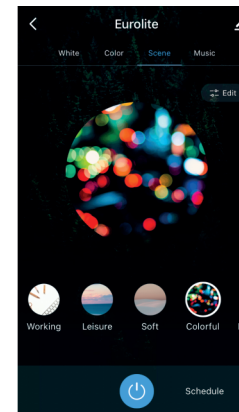

RGB+CCT: Touch the color wheel to adjust the color temperature. RGB switches off automatically. Control the brightness of white with the slider.

8

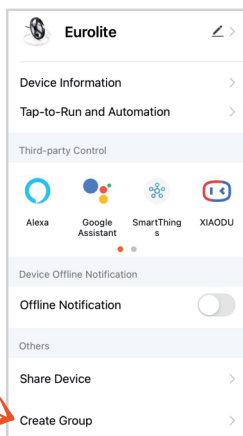

RGB/W: To select a specific RGB color, you can tap it in the color wheel. The two lower sliders can be used to adjust the brightness and saturation.

RGB+CCT: Touch the color wheel to select a specific RGB color. Dual white switches off automatically. Control brightness and saturation with the lower sliders.

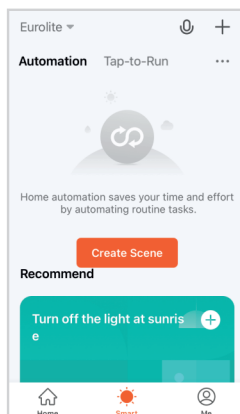

9

Under the Scene tab different color scenes can be selected. Scene 1-4 is static and scene 5-8 is dynamic. Open the Music tab to select sound-controlled light. To turn the light on or off at a specific time, tap Schedule at the bottom.

10

If you tap on the stylus, you can open the device settings. Here you can e.g. share the device with other users and create groups to control several devices simultaneously. Your groups are also displayed in the home screen and can be easily managed from there.

11

Under the smart tab you can create scenes and automations for routine tasks and link them to conditions. The condition can be a particular temperature, time or even a location. The app already suggests various scenes to match the device, which makes it easier to create them.

12

The illuminant can be controlled with the voice assistants Amazon Alexa, Google Assistant and other services. Simply search for the Tuya Smart skill/service in the respective apps and link your Tuya account to Alexa or Google Home. Then ask Alexa or Google to turn on the light, dim it, or set a color. To use Siri, simply create a scene and then tap Add to Siri. The name of the scene is automatically set as a shortcut or you rename it to something else.
